Kalinga Institute of Industrial Technology

Submission Date: 07.11.2026

1. Introduction

K Explore is a responsive event management and discovery website. Visitors can browse upcoming events, search for experiences, filter by category, inspect event details and register for a selected event. The project uses HTML5, CSS3 and vanilla JavaScript.

2. Problem Statement

The project brief requires a modern, responsive event website with an attractive homepage, event cards, search and category filtering, event details, a registration form, JavaScript validation and a confirmation message. Dark mode and Local Storage are suggested bonus enhancements.

3. Objectives

Create an intuitive event discovery experience; present event name, date, venue, image and description; support search and category filters; collect participant details; validate form values and confirm registration; support desktop, tablet and mobile screens; and add dark mode and Local Storage enhancements.

4. Technologies Used

HTML5: Semantic page structure, navigation, event sections, dialogs and form controls.
CSS3: Responsive layouts, grid/flexbox, typography, transitions, theme variables and mobile breakpoints.
JavaScript: Event rendering, search, category filters, dialogs, validation, confirmation, theme switching and Local Storage.
Local Storage: Stores registration records and theme preference in the current browser.

5. System Design and Modules

Home / Hero: Introduces K Explore.
Event Listing: Shows six sample event cards with images, categories, dates, descriptions and locations.
Search and Filters: Matches title, category, venue and description; category chips narrow results.
Event Details: Dialog presents event description, time and venue.
Registration: Collects name, email, phone and selected event. Validation checks name length, email format and a 10-digit phone number.
Confirmation and Storage: Saves valid registration in Local Storage and displays confirmation.
Theme and Navigation: Dark/light preference is persisted and mobile navigation collapses.

6. Website Workflow

Open homepage → browse or search → select a category if desired → open event details → choose Register → enter participant details → JavaScript validates inputs → save valid registration in Local Storage → display confirmation. Invalid values produce an inline error.

7. Validation Rules

Name must contain at least two characters. Email must follow a basic address pattern. Phone number must contain exactly 10 digits. The selected event is populated from the chosen event. Invalid values prevent submission.

8. Responsive Design

At wide widths, event cards appear in three columns; medium screens use two columns; mobile screens use one column and a collapsible navigation menu. Images scale within their containers and controls wrap to fit narrow screens.

9. Testing and Expected Results

Test case	Action	Expected result
Initial load	Open index.html	Homepage and event cards render
Search	Enter keyword	Matching events remain
Category	Choose Technology	Technology events appear
Details	Select View details	Details dialog opens
Invalid form	Invalid email/phone	Error; no record saved
Valid form	Submit valid details	Confirmation; record saved
Theme	Toggle and reload	Theme preference retained
Responsive	Resize to mobile	Single column and menu toggle

10. Limitations

This is a front-end demonstration. Event data is defined in JavaScript and is not fetched from a live server. Registrations are stored only in the visitor's browser and are not transmitted to an organizer. Clearing browser data can remove saved registrations. There is no authentication, payment processing, email notification or admin dashboard. Event details are sample content and should be verified or replaced before real-world use.

11. Future Scope

A future version can connect to a backend and database, provide organizer/admin accounts, enable event creation and editing, send email/SMS confirmations, support payments, manage capacity and waitlists, and issue QR-code tickets.

12. Conclusion

K Explore fulfils the core front-end requirements of the supplied web designing brief. It combines event discovery, search and filtering, event details, validated registration and confirmation in a responsive interface. Dark mode and Local Storage add functionality while keeping the project easy to run and deploy.

13. Project Structure

```
k_explore_project/
■■■ index.html
■■■ style.css
■■■ script.js
■■■ README.md
```

14. Run and Deployment Instructions

Open index.html in a modern browser. Alternatively, run `python3 -m http.server 8000` in the project directory and open `http://localhost:8000`. Push the project to GitHub and deploy using GitHub Pages, Netlify or Vercel. Add the actual repository and deployment URLs to README after publishing.
